

ULTRA BIOGUARD

For freshwater and saltwater

High concentration of aerobic and anaerobic bacteria and natural probiotics.

Biological action three times faster in your aquarium.

Our bacteria can rapidly decompose nitrous acid, ammonia, nitrates, hydrogen sulfide, and other harmful substances. They can further purify the aquarium bottom and filter organic matter, biological waste, unconsumed food, and other substances.

Highly concentrated.

Its formula is optimized to achieve high concentration and excellent performance:
1ml of product treats 10 liters of water in your aquarium.

Three years of research and development to obtain a powerful universal biological conditioner with various strains of live bacteria that do not emit unpleasant odors.

High-quality real bacteria that are much more robust, concentrated, and their fragrance increases over time.

- 1.- Live and robust symbiotic bacteria resilient to physical-chemical changes.
- 2.- Direct application to the aquarium, no activation or refrigeration required to preserve their properties.
- 3.- More concentrated product, over time it increases its capacity and metabolic action.

Patented biotechnology for preservation through microbial symbiosis.

We harness bacterial symbiosis to achieve higher performance and preservation. Our patented technology allows for the long-term preservation of multiple microbial strains, maintaining optimal and steadily increasing activity and effectiveness. Thus, the strains continue to develop during storage in the container, acquiring an increasingly darker tone in the solution and further enhancing their performance.

You can apply the solution directly and dry onto the filter media, substrate, or gravel of your aquarium

The bacterial strains in **Ultra Bioguard** have high tolerance and robustness, being highly active in all types of environments. You can directly apply the solution onto substrates and filter media while dry, and the strains will adhere to them, activating upon immersion in water.

Natural food for juvenile shrimps and fish.

It contains abundant probiotics with a cell diameter of up to 10 µm. This product can be used directly to feed juvenile shrimps and fish, or it can also be added to the diet of fish and other ornamental organisms. Its bacteria and probiotics quickly integrate into their intestinal microbiota as dominant species, providing great benefits to the aquarium inhabitants, improving digestion, the immune system, and increasing their survival rate.
